The Sentinel 4 entrypanels, manufactured from marine grade stainless steel or solid brass and finished in a satin grain are complete with a flush mounting or surface mounting backbox.

Fully sealed against the weather, functional panels (ie a button per flat) can call up to 14 flats and digital panels (dial number in) over 1000 flats, with no limitation on the number of call panels on any one system.

Both panel formats include an LED display which displays the flat number and “call” when flats are being called, “thru” when the handset has been lifted and “door open” while the door has been released. The user also has visual reassurance of trades operation and audible reassurance while flats are being called and the door is being released.

User programmable access codes up to 8 digits are standard on both digital and functional panels.
